Impact of Emotional Intelligence on Teacher's Performance in Technical Education Institutions of Madhya Pradesh

Sanchika Modi, Mukesh Chansoriya

Abstract: This research paper aims at investigating the impact of emotional intelligence on teacher's job performance in the education sector of Madhya Pradesh. Sample size consists of 166 teachers from universities in the area of Madhya Pradesh. Theories of emotional intelligence proposed by Salovey and Mayer (1989–1990) were used as the conceptual framework and its relationship with the job performance of teachers was examined. Reliability and validity of variables was tested through measurement model of PLS-SEM. The result indicated that emotional intelligence has a significant impact on the teacher's job performance. Key research finding revealed that emotional self-awareness, self-confidence, achievement, developing others and conflict management have a positive and significant relationship with the teacher's job performance.

Keywords: Emotional Intelligence; Performance; Teachers; Madhya Pradesh

I. INTRODUCTION

Despite the advancement in technology and educational reforms, the educational institutes face certain challenges and issues related to the education system. These issues are mainly concerned with the poor academic performance, demands and expectations of parents, declining quality of education, non-serious attitude of the students, heavy workload on teachers’ etc. such issues make it difficult for the teachers to cope with the academics as well as societal demands of the parents and students. Social pressure on teachers could result in emotional disturbance and challenges. Ignat and Clipa (2012) are of the view that, if teachers put efforts in developing their professional and emotional competencies, then such challenges can be met easily. In this regard, emotional intelligence (EI) serves as a significant tool that helps the teachers to adjust their emotions and meet the societal challenges that disturbs the balance of their emotions. In addition, Beilock and Ramirez (2011) also identified the significance of studying the emotions in the class room environment so as to understand the learning patterns and motivations of the students.

Although, technological revolution and educational reforms has improved the education system of Madhya Pradesh, teachers are having issues to identify their roles as teachers towards the community. Moreover, the societal demands make it difficult for them to balance their emotions at work.

Therefore, there is need to improve their emotional intelligence so that the performance could be increased and positive work related outcomes could be achieved.

The purpose of this study is to identify the relationship between teachers’ emotional intelligence and their work performance. Furthermore, how to enhance the performance by managing the emotional intelligence of the teachers? This paper also provides insights on measuring the performance of the teachers through emotional intelligence. This study will be helpful for the educational institutes to understand that, to what extent emotional intelligence contribute towards increasing the performance of the teachers. It will be helpful in designing certain programs and strategies to boost the emotional intelligence of the teachers so that they not only meet the workplace challenges but also increase their performance through effective management of their emotions.

II. LITERATURE REVIEW

A. What is Emotional Intelligence?

The concept of emotional intelligence (EI) originated back in 1920s when Thorndike (1920) for the first time conceptualized the emotional intelligence into three dimensions i.e. abstract intelligence, mechanical intelligence and social intelligence. Afterwards in 1980s, several scholars made further contributions to the concept of emotional intelligence, e.g. Gardner (2013) came up with the idea of intra-emotional intelligence and inter-emotional intelligence. The work of Steiner (1984) conceptualized the notion of EI. The contribution of these scholars gave rise to the emergence and development of the concept “emotional intelligence” by Salovey and Mayer (1990). In the subsequent years, emotional intelligence was studied extensively in the literature of organizational behavior, human resources, and management and many other disciplines.

The contribution of Salovey and Mayer (1990) is substantial, as they suggested a model for emotional intelligence by defining EI as part of the social intelligence, which deals with the ability of an individual to regulate his/her personal, and others’ emotions and feelings. It helps them differentiate and manage their reasoning and actions. Mayer, Caruso and Salovey (1999) redefined the concept of EI as the capability of an individual to identify access and produce emotions in order to facilitate the judgments. Moreover, EI helps understand and regulate feelings, emotions and emotional knowledge to promote the growth of emotions and intellectuality.

B. Emotional Intelligence and Job Performance

Previous research studies have discovered strong correlation between emotional intelligence and work related outcomes. In this regard, Mayer and Cobb (2000) are of the view that emotional intelligence cast positive effect on job performance and interpersonal interactions, thereby influencing the work related outcomes of the individuals. The association between Emotional intelligence and performance was explored by many research scholars. For instance, Fox and Spector (2000) claimed that, trait based emotional intelligence has positively influence the performance of individuals in interview. It also improves the contextual performance of the individuals (Carmeli, 2003).

Day and Carroll (2004) explored the relationship between various aspects of emotional intelligence and individual performance in terms of decision making. They explained that, better performance can be achieved through emotional performance. Mayer, Salovey, Caruso and Sitarenios (2001) are of the view that, individuals who are highly emotional intelligent are capable to recognize and understand the emotions of the coworkers, superiors and customers. As a result of which they can respond to their emotions appropriately. Furthermore, they keenly observe the emotions of their work fellows and then respond them accordingly, which give rise to smooth relationship at workplace.

There are many individual task related to the job that are likely to affect the job performance of individuals at work. Such tasks related to job consist of the standard job description (Murphy & Kroeker, 1988), as well as the other variables like interpersonal relationships, turnover intentions, absenteeism, withdrawal behaviors and other attitudes and behaviors of the employees that are result in destructive outcomes which affect the job performance of the individuals (Murphy, 1989).

In highly cognitive tasks, emotional intelligence momentously affects performance of the individuals in the group tasks. Emotional intelligence helps individuals in predicting their performance particularly in team work (Offermann, Bailey, Vasilopoulos, Seal & Sass, 2004). Whereas, the measures of cognitive ability help in estimating the individual tasks performance of the students like class tests. Moreover, the measures of the cognitive capability and emotional intelligence help in predicting the emergence of the leadership (Kellett, Humphrey & Sleeth, 2006).

However, the cognitive complexity of the job has profound effects on the emotional intelligence as well as cognitive abilities of the individuals.

Emotional intelligence is of particular concern in the services sector where the interaction among the individuals is direct and frequent. In a research study conducted in the food services, Sy, Tram and O’Hara (2006) are of the view that highly emotional intelligent leaders are more capable of managing the job satisfaction of their subordinates in the organization. Likewise, other authors have also investigated the relationship between transformational leadership and their ability to alter the moods and emotions while dealing with the customers and subordinates (Bono, Foldes, Vinson & Muros, 2007). Leaders who are highly emotional intelligent tend to exhibit emotional labor at workplace by maintaining positive temperaments when interacting with others. Emotional labor in this context can be described as managing and modifying one's emotions to meet the regulations of job and organization (Diefendorff, Croyle, & Gossenrand, 2005; Pugh, 2001). Bono and Vey (2007) highlighted the significance of emotional labor in performing the jobs in the services sector. However, Grandey, Fisk, and Steiner (2005) posit that, emotional labor can be bit demanding for those employees who do not have sufficient autonomy in their jobs. However, employees can manage and regulate their emotions to deal with a stressing situation.

Individual’s ability to recognize their emotions helps in managing their emotions while interacting with others. In the same manner, it also helps in understanding when the emotional labor needs to perform. Brotheridge (2006) is of the view that, role of emotional intelligence is vital in forecasting the perceived situational demands which then predict further about the emotional labor. Those employees who are highly emotional intelligent tend to perceive that expressing the emotions is required by their job. Similarly, for those jobs which require emotional labor, the performance of such job can be predicted through emotional labor (Joseph & Newman, 2010).

C. Conceptual Framework

According to Goleman (1995), the emotional intelligence comprises of five basic components known as emotional self-awareness, self-recognition, handling relationships with others, motivating others and managing emotions. In current research framework, six dimensions of Emotional intelligence have been taken into consideration in order to investigate their relationship with the job performance of teachers.

According to Qualter, Gardner, Pope, Hutchison and Whiteley (2012), emotional efficacy plays an important role in enhancing the abilities of emotional self-management among individuals with respect to their academic tasks. Moreover, Barsad (2000) posits that, when positive emotions are developed in the employees in a group, it increases their cooperation with each other and reduces the conflicts which in turn enhances the efficiency and performance of the group members. In their research study, Salami (2010) revealed that, the academic achievement and performance of the students can be enhanced through self-efficacy, emotional intelligence and psychological well-being. In his research study, Bar-On (1997) explored the notion of emotional intelligence and highlighted internal, personal, compatibility, and general mood components. The internal components comprise of emotional self-awareness, self-respect, self-actualization, assertiveness and independence. The personal elements include social responsibility, managing interpersonal relationships and empathy. Other components include reality, problem solving skills, impulse control, self-prediction, tolerance and happiness. On the basis of the notion of Bar-On (1995) and Goleman (1995), following hypotheses can be proposed:

H1# Emotional self-awareness has a significant and positive relation with Teacher's job performance.
H2# Self-confidence has positive and significant
relation with Teacher's job performance. 
H3\textsuperscript{4} Achievement has positive and significant relation with Teacher's job performance. 
H4\textsuperscript{4} Developing others has positive and significant relation with Teacher's job performance. 
H5\textsuperscript{4} Conflict management has positive and significant relation with Teacher's job performance.

Mayer et al. (2000) argues that emotions play a crucial role in influencing the mental operations of the individuals along with cognition and motivation. It is crucial to study the emotions of teachers as well as their management of emotions which has found to affect their thinking, categorization as well as problem solving. There are various dimensions that are related to the teacher's performance in the class which have traces of emotional intelligence components such as class room management, teaching methods and styles, individual differences and problem solving, use of motivational tools and direct teaching methods.

Teaching styles are found to affect the academic performance of the students. Grasha (1996) defined teaching styles as the outline of their knowledge, beliefs, performance and behavior during the teaching process. The teaching styles comprises of five dimensions which include formal style of authority, personal style, facilitator style, expert and delegation. Ingersoll and Smith (2003) argued that, the competencies of the class teachers regarding the behavior management and classroom management affects the preservice of the newly appointed teachers. Those teachers who fail to maintain discipline in class by managing their behavior cannot perform well in their initial phase of their career, which necessitates a high emotional intelligence. In addition, Oliver and Reschly (2007) highlighted the significance of emotional intelligence and behavior management of teachers in their class room which affect the outcomes of the students. Implementation of an appropriate teaching method and style tend to affect the performance of students and also reflect teacher's own performance. A good teaching method and style is reflected in the embodiment of training values which enhance their understandings and motivate them to think critically and believe in themselves (Iurea, Neacsu, Safta, & Suditu, 2011).

Motivation is also related to the emotional intelligence of the teachers as those teachers who are highly emotional intelligent tend to motivate their students as well as keep themselves motivated. Teachers can create an effective learning environment in which can be used to create a vision for the students, achieving their own development and satisfying the students. In order to perform better and to achieve the better academic outcomes of their students, teachers need to use effectively class room management techniques along with the key emphasis on the areas of behavioral challenges of the students such as their psychological wellbeing, disruptive behaviors, interpersonal relationships and academic performance of the students (Fernández-Berrocal & Ruiz, 2008). In this regard, the relationship of the emotional intelligence and teacher's job performance has been measured in current research study using five components of teacher's performance i.e. classroom management, individual differences and problem solving, motivational tools, teaching styles and methods.

III. METHODOLOGY

A. Sample

For the existing study convenience sampling of 166 teachers who were working in the education sector of Madhya Pradesh were chosen. 65% samples were consisted on males and the rest 35% were females. Largely the respondents were from 25 to 35 years of age group.

![Conceptual model](image)

Fig. 1. Conceptual model (Adapted from Mehmood, Qasim & Azam, 2013).

IV. RESULTS

Current research study followed the modeling process consisted of two steps i.e. measurement model and structural model by using PLS software (Anderson & Gerbing, 1988; Lowry & Gaskin, 2014). This two way step modeling is known as (PLS- SEM) partial least square structural equation modeling (Hair, Anderson, Tatham & Black, 1998). While running the measurement model, authors checked the reliability and validity of the items and then in order to check the direct relations between the variables structural model has been tested.

A. Measurement Model

With the help of measurement model of PLS- SEM, reliability of the variables can be easily checked. It also allows to do confirmatory factor analysis which will give researchers the factor loadings of items which must be greater than 0.5 (Hulland, 1999). Below Table 1 is giving the factor loadings of items which are greater than 0.5 and 0.7. Item named as SC 10 was deleted as its value was less than 0.5 (Lowry & Gaskin, 2014). Above Table 2 is giving chronbach alpha explaining the internal consistency among the items and values of all items is greater than 0.7 (Fornell Larcker, 1981). The average variance for the variables must be near or greater than 0.50 ranging from 0.65 to 0.82 which shows the accurate and accepted reliability given by Spreng and Mackoy (1996). Hence every variable within the model is reliable and shows the reliable measurement model. In the above table composite reliability ranges from 0.906 to 0.978 which is greater than 0.7 (Hair et al., 1998) and it shows better reliability than chronbach alpha.
B. Structural Model

Structural model was run to check the hypothesis and the relationship among the variables (Hair et al., 1998). PLS-SEM structural model has been used to analyses the interaction between independent and dependent variables (Lowry & Gaskin, 2014). Below Table 3 is indicating the significance level as well as the t - values which showed the acceptance and rejection of the hypothesis. By having a glance on the results for the interaction between independent variables and dependent variable, was depicting the value near and greater than 2 (Lowry & Gaskin, 2014) in which p value is less than 0.005. Mean values are from 0.13 to 0.28 and standard deviation ranges from 0.06 to 0.109. All the hypothesized associations are significant (p<0.005).

V. DISCUSSION

The present study add a valuable addition in the “Appraisal theory of emotions” which indicates that the similar outer events would not leads to the similar emotions within the individuals or what are the reasons behind the different emotions within the individual that the teacher's involvement in response to the similar behavior of the student (Sutton & Wheatley, 2003). The role of culture in emotions are the vital in order to understand the appraisal theories of emotions. Mesquita and Ellsworth (2001) stated that presence of orderly cultural differences in having idea and clarification of the similar events depend on the cultural differences in emotion and feelings.

The main purpose of the present study is to indicate that the improved emotional intelligence leads towards the better teacher's job performance. The first hypothesis was emotional self-awareness has significant and positive impact with the teacher's job performance and it is accepted statistically as well. Emotional intelligence is the capacity to observe and express feelings and emotions, and dealing them in an effective way which would increase the chance to enhance the personal development (Corcoran & Tormey, 2013). Results shows that t-value is 1.59 which is near to 2 which indicates that emotional self-awareness has positive impact to teacher's job performance. Emotional Self-awareness is related to the getting deep into the emotions and understanding them thoroughly and having emotional knowledge which would ultimately lead to the strength of individual job performance (Malik & Shahid, 2016). In the second hypothesis, self-confidence has positive and significant relationship with the teacher's job performance. As the results showed that the T-Value is 2.08 and it is significant. Mayor and Salovey (1997) examined that emotional intelligence is the composition of different competences which has the possibility to distinguish feelings within the person which effects the productivity and increase individual's performance. Study indicated that teachers having increased level of emotional intelligence can perform in a better way rather than having less emotional intelligence (Mayor & Salovey, 1997; Mehmood et al., 2013). Achievement has positive and significant relation with teacher's job performance. According to goal-setting theory given by Locke and Latham (1990) stated that having positive mood would lead to the more determined goals. Moreover, positive mood and emotions may lead teachers to give better performance and produce more productive challenges and objectives for students and would set determination for their own teaching (Sutton & Wheatley, 2003). Likewise, developing others and conflict management has positive and significant relationship with the teacher's job performance. EI model consisted of three main mental processes containing evaluation and explicit emotions within oneself and among

Others which is associated with the knowledge of verbal and non-verbal expression of emotions (Salovey & Mayer, 1990). The second component is adapting emotions in self and other individuals. Third component is use of emotions in adaptive ways. Following is the brief description of the components of EI model.

A. Limitations and Future Directions

Regardless of its implications, current research study is prone to some limitations. This study is focused on educational sector of Madhya Pradesh. Future researchers can replicate the same study in any other sector. In the existing study the correlation between emotional intelligence is checked with teacher's performance, future researchers should also consider other dependent variables like employee satisfaction and employee performance. Some of the contextual variables can also be added in the present theoretical framework, for example employee engagement. The effect of any mediator can also be introduced which can be self-leadership.

VI. CONCLUSION

Teachers have a significant role in society as they interact with the students to transfer their knowledge to them. For transferring knowledge in a proper way they should be emotionally stable (Mehmood et al., 2013). Teachers should have effective skills physically as well as mentally which are named as emotional intelligence (Goleman, 1995). Emotional intelligence is really helpful for teacher's performance as it would guide them to communicate clearly, lead others in a proper way which creates productive interaction at work as well as personal life (Hassan et al., 2015). Present study indicated that when teachers developed emotional competencies and skills which made a complete emotional intelligent behavior and attitude result in the huge success and satisfaction (Hassan et al., 2015). Mehmood et al. (2013) suggested that teachers having good emotional intelligence would have improved performance.
