The Impact of Modern Crisis Management Strategies on Crisis Management Planning

Amany Saflo, Mostafa Aldarwish, Hussam Khadija

Abstract: The research aims to identify modern strategies for crisis management, and their impact on planning for crisis management, where the research was applied to employees in the directorates of the university presidency and its offices, totaling (75) employees. The researcher used the descriptive approach, and a questionnaire consisting of (28) items was prepared. It included two approaches (modern strategies for crisis management, and crisis management planning). A questionnaire was distributed electronically to a research sample of (60) employees, which was determined from the Krejci and Morgan table. The researcher found that there is a statistically significant effect of modern strategies for crisis management on management planning the crisis, at the level of significance of 5%, and the most modern used strategies were the strategy of Crisis Fragmentation, followed by Changing Path strategy, then the strategy of Containing the Crisis, then the strategy of Crisis Exhauling, followed by the strategy of the Work Teams, then the strategy of the Mobilization Reserve in the last phase. The research concluded there are no statistically significant differences in modern strategies for crisis management according to the variable (gender, educational qualification, respondent’s character, age), at the level of significance of 5%, and the researcher recommended the need to form task forces to manage crises in colleges with expertise, provide the necessary material and human support.

Keywords: Crisis Management, Modern Strategies for Crisis Management - Crisis Management Planning.

I. INTRODUCTION

Crisis have become an essential feature of contemporary institutions in the 2000s, due to the dynamism and complexity of the business environment, so all organizations have become vulnerable to the occurrence of crises, and since the crisis often coincides with the element of surprise, this requires the ability to anticipate it and avoid its occurrence, with the presence of high skills to address it, through Paying attention to methods of confronting them and adapting.

In today’s world, it is difficult to find organizations that deal with crises randomly and improvised, which makes them vulnerable to surprises and bad situations that stand before them unable to act, and the consequent threat to their future and existence (Abu Halima, 2013, p. 1).

The success of forecasting in crisis management is not done efficiently and effectively except through the availability of accurate and up-to-date information about the crisis, whether at the level of the organization or outside it. Therefore, there must be a management information system that provides this important and useful information to all departments at the administrative levels.

Since HEIs are among the important institutions of society and an integrated part of it, they are exposed to multiple and varied crises, including those related to their internal environment, including external ones, and this was known by the researcher’s work as a lecturer at the university. These crises of all kinds need to be addressed so that they do not exacerbate further, and transform from weaknesses into strengths for the benefit of the university. Besides, it is not correct to deal with those crises through a direct reaction, as there are modern and effective strategies for crisis management, hence the idea of our research is to identify modern strategies for crisis management, and their impact on planning crisis management at Idlib University.

II. PROBLEM OF THE RESEARCH

Any university faces multiple and diverse crises, which differ in the causes of their occurrence, the severity of their effects, and the degree of recurrence, which requires the university administration to search for modern strategies for crisis management, to reduce them, mitigate their negative effects, and avoid their occurrence in the future, which helps in forecasting and planning for managing Crises. Therefore, the research problem can be summarized by the following question: (What are the modern strategies for crisis management, and what is their impact on crisis management planning).

III. IMPORTANCE OF THE RESEARCH

Scientific Impact: First, the research deals with an important topic (crisis management planning), which is dealt with for the first time at the University of Idlib, according to the researcher. Second, it contributes to the enrichment of the Arabic library in general and the library of Idlib University in particular.

The Impact of Modern Crisis Management Strategies on Crisis Management Planning

Practical Impact: Relying on the results of the study to draw the attention of officials in senior management to the importance of applying modern strategies for crisis management when planning for future crises, and thus preparing for such crises before they occur, and avoiding their negative effects.

IV. OBJECTIVES OF THE RESEARCH
The research aims to:
1- Identify the concept of crisis, crisis management, and crisis management planning.
2- Identifying modern strategies for crisis management.
3- Identifying the impact of modern crisis management strategies on crisis management planning.
4- Reaching a set of results and making recommendations that help the university plan to manage its crises in the future.

V. RESEARCH HYPOTHESES
The first main hypothesis: There is no statistically significant effect of modern crisis management strategies on crisis management planning, at the level of statistical significance of 5%.

The second main hypothesis: There are no statistically significant differences in the perception of the research sample members of the modern strategies for crisis management used to plan crisis management according to the variable (gender, educational qualification, the attribute of the respondent, age), at the level of statistical significance 5%.

VI. RESEARCH VARIABLES

- **Independent variable:**
  - Modern strategies for crisis management
  - Break up the crisis
  - Crisis containment
  - Crisis dump
  - Change the course of the crisis
  - Tactical reserves, task forces

- **Dependent variable:**
  - Crisis management planning

VII. RESEARCH METHODOLOGY
To achieve the objectives of the research, the descriptive approach was used, which describes the phenomenon under study, and interprets the relationship between the research variables according to the following:

The descriptive side: through reading Arab and foreign books, periodicals, and research related to crises, crisis management, crisis management strategies, and crisis management planning.

The analytical aspect: A questionnaire was designed to find out the modern strategies used for crisis management, and their impact on crisis management planning, then apply them to the research sample, then tabulate and analyze this data using the appropriate statistical treatments in SPSS V.18 to reach the results.

VIII. DATA COLLECTION TOOLS
The research relied on a questionnaire prepared by the researcher addressed to the university presidency and its administrative units, to find out the modern strategies for crisis management, and their impact on crisis management planning.

IX. RESEARCH PARAMETERS
- First: Spatial Parameters: The research was conducted at the University of Idlib.
- Second: Time Parameters: the research was applied in 2022.
- Third: Institutional Parameters: The research was limited to the directorates and offices of Idlib University.
- Fourth: Capacity Parameters: Employees in the directorates and offices of the University of Idlib.

X. RESEARCH COMMUNITY AND SAMPLE
The research community includes the directorates of Idlib University and its offices, which number (10) directorates (University of Idlib, 2022), and the number of employees in it is (75) employees (University of Idlib, 2022), while the research sample has been using the sample law \( n = \frac{X2Np(1-p)}{e^2(N-1)+X2P(1-P)} \), and from the tables of Craigsey and Morgan were determined, so the population whose size is (75) is single, its sample is (63) single (Craigsey, and Morgan, 1970, p. 610). (3) questionnaires were excluded because the employees did not respond to the researcher, so the research sample was (60) employees

XI. TERMINOLOGICAL AND PROCEDURAL DEFINITIONS
- **Crisis:** A critical period or unstable situation awaiting decisive change.
- **Crisis Management:** how to overcome crises with various scientific and administrative tools, control their pressure, course, and trends, avoid their negatives, and benefit from their positives.
- **Modern Strategies for Crisis Management:** They are non-traditional methods and strategies that fit the spirit of the modern era, used in crisis management.
- **Crisis Management Planning:** It is an organized and continuous process subject to elaborate controls that take place in advance of the expected timing of potential crises.

XII. LITERARY REVIEW
The goal of the study was to determine how contemporary crisis management tactics affected the marketing success of publicly traded local banks in the Gaza Strip. The study's key findings include a discrepancy between the importance of using contemporary crisis management techniques in the banks under study due to the nature of those techniques, where the strategy for preventing the crisis from starting in the first place and the strategy for breaking it up are conflicting, the strength of the correlation between the independent variables, and the presence of a significant effect. The statistical significance of current crisis management strategies (altering course, mobilizing reserves, defusing the crisis, breaking up the crisis, and containing the crisis) on marketing outcomes (creating services and products, realizing profits, and increasing market share) in the banks under investigation. The use of either strategy—changing the crisis' trajectory or breaking it up—had no statistically significant impact on how well local banks were doing in their marketing. It is possible to draw the conclusion that the application of alternative tactics affects the advertising efficiency of local banks operating in the Gaza Strip in a statistically significant manner.

2. A study (Al-Derawi, 2020) entitled (Strategic Planning and its Relationship to Crisis Management)

This study aimed to determine how crisis management and strategic planning interacted at the Al-Amal Institute for Orphans in the Gaza Strip. The degree of risk in decision-making, the amount of medium-term strategic planning, the strategic planning's contribution to problem-solving, and the absence of employee involvement are all barriers to problem-solving.

Among the most important findings of the study, is the practice of strategic planning with a high level, and among the obstacles to strategic planning are the lack of financial capabilities, and the lack of support from the administration, in addition to changing the staff from time to time. The study has also demonstrated that the degree of practice of strategic planning in crisis management is different due to the gender variable in favor of males, and there is no difference due to the nature of work variable (employee, volunteer).

4. A study (Samaneh and Al-Khaddam, 2016) entitled (Crisis Management Methods and their Relationship to Strategic Planning in the Jordanian Ministry of Interior)

In the Jordanian Ministry of Interior, the study's goal was to pinpoint crisis management techniques and their relationship to strategic planning (JMI). One of the study's most significant findings is the existence of variations in the estimates of administrators working in the Ministry of Interior related to the gender variable (in favor of males); this finding has been utilized to guide the development of crisis management techniques (escape, containment, confrontation, cooperation). The variables of educational background and years of experience, as well as the high level of use of administrators of strategic planning processes with a relative weight of (84.82%), do not differ. Due to the gender variable working in favor of men, there are disparities in people's interest in strategic planning procedures.

5. A study (Nour Al-Daeem, 2015) entitled (The Impact of Management Information Systems on Crisis Management)

The goal of the study is to evaluate how management information systems for crisis management affect business organizations' performance and continuity. The research's most significant findings include the absence of a crisis management system in the factory, which has an adverse impact on the crisis' resolution, the absence of a crisis management system in the factory's various stages, and the existence of a link between the success of systems management information and crisis management in the factory.

6. A study (Baubion, 2013) entitled (Strategic Crisis Management)

The research aims to identify crises and their risks to the performance of institutions, methods of managing and confronting crises, and ways to manage crises perfectly and effectively. The research concluded that crisis management needs several things to succeed, including planning, follow-up, and evaluation for each stage.

7. A study (Austino, o., 2014) entitled (Crisis Management to ensure effective and continuous performance)

The research dealt with crisis management and concluded that the effectiveness of performance within the organization is affected by the crisis management process and the importance of the organization having a team capable of managing the crisis efficiently. The study emphasized that the survival and continuity of the organization depend on the efficiency of crisis management, as some crises may harm the reputation of the organization, and the need for the crisis management team to have plans, policies, and strategies for managing the crisis, as well as for it to have full information that enables it to manage the crisis.

XIII. THEORETICAL APPROACH TO CRISIS

1. Concept of Crisis

The concept of crisis is one of the concepts commonly used in all journals, even in our daily lives. This has led to the difficulty in developing a comprehensive definition of crisis, due to the huge amount of studies published during the past years on the meaning of crisis, which tried to address this meaning from its various angles (Ben Jameh, 2010, p. 9). Webster's dictionary defines a crisis as a critical period or an unstable state awaiting a decisive change (Mazloum, 2012, p. 4). A crisis is also defined as an unexpected and sudden event that threatens the organization's operations and leads to disruption of the organization's reputation (Coombs, 2007, p164).

2. The Concept of Crisis Management

The term crisis management comes in the context of modern terminology that has occurred in the means of internal and international dealings, and this term remained restricted by the traditional concepts that governed relations at their different levels,
until the end of World War II. The term was developed after that significantly due to the close association with various affairs. Crisis management has obtained very high concerns from the international community and its methods of dealing with its management (Maryam, 2019, p. 13). The definitions of crisis management have multiplied by the multiplicity of concepts, and the divergence of points of view.

Margaret defined it as the application of strategies designed to help an organization in which a negative event, suddenly occurred, as a result of an unpredictable event, or as an expected result of some events that constituted a potential danger, which necessitates that decisions be taken quickly to limit the damage to the organization (Margaret, 2013, p3). Crisis management was also known as overcoming crises with scientific tools management, controlling its pressures, paths, and directions, avoiding its negative aspects, and benefiting from its positive aspects.

3. Crisis Management Strategies

These strategies emerged as a result of the developments witnessed by the administrative entity, due to the different types, forms, and nature of crises, and they are more effective than traditional strategies and are appropriate to the spirit of the times and its requirements, and among these modern strategies:

4. Crisis Fragmentation

It is used in dealing with crises of magnitude and severity, through detailed and accurate knowledge of the factors causing the crisis, identifying conflicting interests and potential benefits, and then dividing the impact of the crisis into multiple solvable parts Containing the Crisis: It is besieging the crisis or confining it to a limited scope, freezing it at the stage it has reached, absorbing the pressures it generates, and then losing its destructive power. (Al-Deeh, 2012, p. 22).

Changing the Path of the crisis: This strategy is used when exposed to severe crises, the escalation of which cannot be stopped, by changing its course to another, more effective field.

The mobilization reserve: Weaknesses and sources of crises are identified, so a preventive mobilization reserve is formed that can be used if a crisis occurs. This strategy is often used in industrial organizations when a crisis in raw materials or a shortage of liquidity occurs (Ahmed, 2012, p. 42).

5. Crisis Exhausting from its Content:

It is also called "abortion of thought". The crisis revolves around specific content. Therefore, without agreement on this content, it is difficult to continue the pressure driving the emergence of the crisis. Hence, the decision-maker's real task is to empty the crisis of its content (Ayad, 2015, p. 37).

6. Formation of Work Teams:

It is one of the most common strategies used to deal with crises in our present time, as a result of the complex and intertwined relationships and factors driving and stimulating the crisis, as it requires the presence of more than one expert, specialist, and technician in different fields, so that each of the factors is calculated, and the required behavior is determined. To deal with it, an integrated work team is usually formed consisting of several experts and specialists in various disciplines related to the crisis, to discuss areas and ways to deal with it, and to develop a quick, well-studied, and meticulously studied plan of action (Al-Khudairi, 2003, p. 294).

7. Democratic Participation

When a crisis involves people or has a strong human component, it is employed. This approach entails involving the employer and subordinates in an open, democratic disclosure of the situation, its gravity, and a plan for dealing with it (Ahmed, 2012, p. 42).

8. The self-destruction of the crisis and its detonation from the inside

it is used in the absence of information, and the certainty that there is no alternative, and herein lies its danger. This crisis is dealt with (Al-Khudairi, 2003, p. 305) by striking the crisis from its weak sides with a severe strike, attracting some elements of the movement and pushing it to the crisis, eliminating the main elements of the crisis, finding new leaders who are more understanding..

9. False Abundance

In this context, the psychological method is used to cover up the crisis, such as the loss of food supplies. In the course of the crisis, the decision-maker resorts to providing these materials, but temporarily. Based on the foregoing, the researcher focused in her study on the most successful modern strategies for facing crises that were agreed upon by the researchers (Al-Naji, 2012, p. 38). These modern strategies are: (Crisis Fragmentation, containing the crisis, changing the path of the crisis, mobilizing reserves, Crisis Exhausting, and forming work teams).

10. Crisis Management Planning

Crisis management planning is defined as an organized and continuous process that is subject to elaborate controls that take place early before the expected timing of potential crises (Salama, 2019, p. 148). Planning is considered a basic requirement in crisis management (Ahmed, 2012, pp. 50-49):

1. Facilitation of the planning process and its timetable, and review of plans drawn up by managers along the line of authority to ensure their sincerity and non-conflict between them.
2. Studying environmental factors, forecasting, diagnosticing their current and potential effects on the organization, and linking goals, capabilities, constraints, and available opportunities within the organization, as managers often lack sufficient skills to make such predictions.
3. Identify strategic problems, and development of alternative solutions.
4. Continuous evaluation of the organization's strategy, based on planning and control information, helps in the quality of decision-making.

Therefore, the successful management of a crisis begins with well-planned planning, taking into account the setting of goals, ensuring that the individuals around the crisis understand its various dimensions taking into account accuracy when making decisions, in addition to preparing multiple scenarios to confront and solve the crisis (Ahmed, 2012, p. 52).
11. Management information systems and crisis management:

Information technology is used in crisis management in a variety of ways, including by fast reaching the crisis, giving electronic information and scenarios, and, in particular, by making information systems like decision-support systems available. As a result of this advancement in information systems, a specific problem or crisis has emerged as the foundation for advanced planning to support decision-making in the review of crisis handling by developing simulation and prediction models that aid in making the correct decision at the right time. Information will therefore continue to be the primary tool for decision-makers, and as information industry technology advances and its methods of transmission and circulation dramatically increase, all of this will greatly aid in making the best decision quickly to handle crises (Tashtoush, 2020, p. 15).

12. The role of management information systems in facing the crisis:

Crises occur in organizations due to the failure of the decision-maker to predict crises, due to the lack of sufficient information about the organization, thus, the role of management information systems in helping the decision-maker to avoid crises through (Adwan, 2019, p. 48):

- Determine the indicators that predict the occurrence of the crisis through various information.
- Identify crises or predict the possibility of their occurrence.
- Preparing estimates of the potential risks and threats of the crisis.
- Preparing a work team to face the crisis with experience and training in the field of crises.
- Maintaining the flow of information to the crisis management centers in the organization to take the appropriate decision to face the reactions.
- Information plays an important and effective role in modifying previously prepared plans to confront the crisis and its developments.
- Participate in preparing alternatives and identifying the appropriate alternative for decision-making in the face of the crisis.
- Contribute to updating the basic information base of the various crisis management centers.
- Analyzing the causes of the crisis, and benefiting from the results in facing future crises.

(Salama, 2019, p. 152) believes that there is an important role for management information systems of all kinds in facing crises through the following stages:

1. Pre-crisis stage:

The role of management information systems at this stage is represented by the following:

- Contribute to defining the organization's general policy and objectives.
- Contribute to the preparation of estimates of the potential risks and threats of the crisis.
- Contribute to identifying crises or predicting the possibility of their occurrence.
- Building appropriate information bases for each type of crisis that the organization faces.
- Contribute to identifying the indicators that predict the occurrence of the crisis through various information.
- Contribute to the preparation of a work team to face the crisis with experience and training in the field of crises.

2. The stage of the crisis:

The role of management information systems at this stage is represented by the following:

- Maintaining the flow of information to the crisis management centers in the organization to take the appropriate decision to face the reactions.
- Assist in reaching experts and consultants according to specializations appropriate to the crisis.
- Information plays an important and effective role in modifying pre-prepared plans to confront the crisis and its developments.
- Participate in preparing alternatives and identifying the appropriate alternative for decision-making in the face of the crisis.

3. Post-crisis phase:

The role of management information systems at this stage is as follows:

- The company can update the basic data base of the numerous crisis management centers thanks to information systems.
- Assistance with the analysis of the crisis, the causes of its occurrence and drawing up results for future use.
- Assistance in the identification of deviations related to the face of the crisis and the possibility of correcting them to face similar future crises.

4. Phases of crisis management according to management information systems plans:

The phases of crisis management are divided according to the plans developed in management information systems (Adwan, 2019, p. 49):

- The phase of discovering early warning signals: refers to the events that predicted the occurrence of crises, and includes (research and analysis of events that may lead to the occurrence of crises, and interest in events that may be influential in the occurrence of crises).
- Preparedness and prevention phase: Refers to the stage of advanced preparation to avoid crises and deal with them if they occur.
- Damage containment phase: refers to the procedures followed after the occurrence of crises and includes (modern technologies, appropriate distribution, provision of financial needs, and means of communication).
- Recovery phase: Refers to the procedures followed to complete the business after the occurrence of crises, and includes (an informational message to the customer audience, taking the necessary measures for the activity, and providing financial and humanitarian needs).
- Learning phase: Evaluating what has been accomplished in crises (taking advantage of lessons from previous crises, identifying strengths and weaknesses, and continuous evaluation).
The Impact of Modern Crisis Management Strategies on Crisis Management Planning

XIV. PRACTICAL APPROACH

Description of the characteristics of the research sample in terms of (gender, academic qualification, respondent's character, and age).

Figure (1): Distribution of sample items by gender

Figure (1) shows that (85%) of the research sample are males and 15% are females. The researcher explains that the nature of some jobs in the directorates requires more male employees than females, such as (The directorate of Engineering and Transportation, the Directorate of Internal Control, and the Directorate of Publications).

Figure (2): Distribution of the sample according to the educational qualification

Figure (2): shows that (25%) of the study sample hold an institute degree, (70%) hold a university degree, and (5%) hold a Ph.D. The researcher explains that the administrative staff in the administrative units are Institute or university degree holders because master’s and doctoral holders are teachers at the university.

Figure (3): Distribution of the samples according to the characteristics of the work

Figure (3) shows that (45%) of the research sample are administrative employees, and (15%) are managers. The researcher explains that it is normal for the number of administrative employees to be greater than the number of managers because each directorate has (one manager and several administrative staff).

Figure (4): Distribution of sample items by age

Figure (4): The largest percentage of the research sample ranges between the ages of 40-31 years, and the lowest percentage of the research sample is over 51 years old. The researcher explains that when the university announces vacancies, specific ages are required, as well as when hiring fresh graduates, those graduates are young.

Calculating the arithmetic means and standard deviations of the research variables: The following table shows the results of the descriptive statistics related to the research variables.

Table (1): Means, Standard Deviations, and Relative Importance of Research Variables

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Arithmetic average</th>
<th>Standard deviation</th>
<th>Relative importance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modern strategies for crisis management</td>
<td>4.3224</td>
<td>0.37459</td>
<td>86.4%</td>
</tr>
<tr>
<td>Crisis Fragmentation</td>
<td>4.3625</td>
<td>0.56827</td>
<td>87.2%</td>
</tr>
<tr>
<td>Crisis Containment</td>
<td>3.8875</td>
<td>0.87142</td>
<td>77.7%</td>
</tr>
<tr>
<td>work teams</td>
<td>3.5667</td>
<td>0.87074</td>
<td>71.3%</td>
</tr>
<tr>
<td>Crisis dump</td>
<td>3.6375</td>
<td>0.90599</td>
<td>72.7%</td>
</tr>
<tr>
<td>tactical reserve</td>
<td>3.5250</td>
<td>1.00286</td>
<td>70.5%</td>
</tr>
<tr>
<td>Changing Path Strategy</td>
<td>4.0917</td>

<td>81.8%</td>
</tr>
<tr>
<td>Crisis management planning</td>
<td>3.3333</td>
<td>0.90393</td>
<td>66.6%</td>
</tr>
</tbody>
</table>

Table (1) shows that all the values of the arithmetic averages for the modern strategies for crisis management are greater than (3), which is the neutral value, and this indicates that there is a follow-up of modern strategies for crisis management. The strategy most followed was the strategy of Crisis Fragmentation, followed by the strategy of Changing Path, followed by the crisis containment strategy, then the crisis relief strategy, then the work teams, and finally the mobilization reserve strategy, which cannot be finally resolved, due to its nature or the lack of availability of the material and human capabilities necessary to deal with it.
Normal Distribution Test
To determine if the data had a normal distribution, the researcher employed the Kolmogorov-Smirnov test. To validate the research hypotheses, we use parametric tests (ANOVA) if the probability value of the sig data is greater than the significance level (0.05), but if it is less than (0.05), the data does not follow a normal distribution, in which case we use nonparametric tests (Kruskal-Wallis). The following table illustrates the test for the normal distribution of the research variables.

### Table (2): Results of the normal distribution test

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Probability value</th>
</tr>
</thead>
<tbody>
<tr>
<td>The First Parameter: modern strategies for crisis management</td>
<td></td>
</tr>
<tr>
<td>Crisis Fragmentation</td>
<td>0.279</td>
</tr>
<tr>
<td>Crisis Containment</td>
<td>0.161</td>
</tr>
<tr>
<td>Crisis dump</td>
<td>0.141</td>
</tr>
<tr>
<td>Changing Path Strategy</td>
<td>0.150</td>
</tr>
<tr>
<td>tactical reserve</td>
<td>0.133</td>
</tr>
<tr>
<td>work teams</td>
<td>0.221</td>
</tr>
<tr>
<td>The Second Parameter</td>
<td></td>
</tr>
<tr>
<td>Crisis management planning</td>
<td>0.186</td>
</tr>
</tbody>
</table>

Table (2): The probability value of the two approaches of modern strategies for crisis management and planning for crisis management is greater than (0.05), and therefore the data follows a normal distribution.

### Research Hypotheses Test:

Testing the first main hypothesis: There is no statistically significant effect of modern crisis management strategies on crisis management planning, at a statistical significance level of 5%. The researcher used the multiple regression test to test the impact of modern crisis management strategies on crisis management planning. The following table shows the results of the correlation coefficient and the coefficient of determination between the research variables.

<table>
<thead>
<tr>
<th>Model</th>
<th>correlation coefficient</th>
<th>The coefficient of determination</th>
<th>Modified coefficient of determination</th>
<th>standard error of the estimate</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0.771 *</td>
<td>0.594 [b]</td>
<td>0.548</td>
<td>0.00747</td>
</tr>
</tbody>
</table>

a. The independent variable: modern strategies for crisis management.

b. The dependent variable: crisis management planning.

Table (3): The results of the correlation coefficient and the coefficient of determination between the search variables

### Table (3): Pearson correlation coefficient between the dependent and independent variables, where it reached an above-average value (0.771), with a determination coefficient value (0.594), and a mean determination coefficient value (0.548), i.e. the independent variables explain 54.8% of the variance in crisis management planning.

The following table shows the results of the ANOVA analysis of the search variables:

<table>
<thead>
<tr>
<th>sources of contrast</th>
<th>sum of squares</th>
<th>degrees of freedom</th>
<th>medium square</th>
<th>F value</th>
<th>df</th>
<th>Statistical significance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Between groups</td>
<td>28.650</td>
<td>6</td>
<td>4.775</td>
<td>12.940</td>
<td>0.000</td>
<td>Statistically significant</td>
</tr>
<tr>
<td>Within groups</td>
<td>19.538</td>
<td>53</td>
<td>0.369</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Total</td>
<td>48.208</td>
<td>59</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

a. The independent variable: modern strategies for crisis management.
The following table shows the results of the Levene test by educational qualification:

**Table (6): Levene test results by academic qualification**

<table>
<thead>
<tr>
<th>Levene value</th>
<th>degrees of freedom</th>
<th>Moral</th>
<th>Statistical significance</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.583</td>
<td>2</td>
<td>0.561</td>
<td>Statistically non-functional</td>
</tr>
</tbody>
</table>

Table (6) shows that the probability value of sig is equal to (0.561) greater than (0.05), and it is considered not statistically significant, that is, the variance is homogeneous, so we do the parameter test (ANOVA).

The following table shows the results of the ANOVA test by academic qualification:

**Table (7): Anova test results by academic qualification**

<table>
<thead>
<tr>
<th>source of contrast</th>
<th>sum of squares</th>
<th>degrees of freedom</th>
<th>medium square</th>
<th>F value</th>
<th>Moral</th>
<th>Statistical significance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Between groups</td>
<td>0.139</td>
<td>2</td>
<td>0.070</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Within groups</td>
<td>8.139</td>
<td>57</td>
<td>0.143</td>
<td>0.488</td>
<td>0.616</td>
<td>Statistically non-functional</td>
</tr>
<tr>
<td>Total contrast</td>
<td>8.279</td>
<td>59</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table (7) shows that the probability value (0.616) is greater than (0.05), and it is considered not statistically significant, and therefore we conclude that there are no statistically significant differences between the average responses of the respondents about modern strategies for crisis management according to the academic qualification at the level of significance of 5%. The researcher explains this as the fact that most of the employees in the administrative units hold university degrees.

As a result, "we accept the null hypothesis regarding the educational qualification variable," which states: "At the level of significance of 5%, there are no statistically significant variations between the averages of the respondents’ comments about modern tactics for crisis management." The following table shows the results of the Levene test according to the characteristics of the respondent.

**Table (8) the results of the Levene test according to the variable of the respondent’s characteristic**

<table>
<thead>
<tr>
<th>Levene value</th>
<th>degrees of freedom</th>
<th>Moral</th>
<th>Statistical significance</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.478</td>
<td>2</td>
<td>0.623</td>
<td>Statistically non-functional</td>
</tr>
</tbody>
</table>

Table (8) shows that the probability value is equal to (0.623) greater than (0.05).

The following table shows the results of the ANOVA test according to the respondent trait variable:

**Table (9): Results of the Anova test according to the characteristics of the respondent**

<table>
<thead>
<tr>
<th>source of contrast</th>
<th>sum of squares</th>
<th>degrees of freedom</th>
<th>medium square</th>
<th>F value</th>
<th>Moral</th>
<th>Statistical significance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Between groups</td>
<td>0.104</td>
<td>2</td>
<td>0.055</td>
<td>0.363</td>
<td>0.697</td>
<td>Statistically non-functional</td>
</tr>
<tr>
<td>Within groups</td>
<td>8.174</td>
<td>57</td>
<td>0.143</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Total contrast</td>
<td>8.279</td>
<td>59</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table (9) shows that the probability value (0.697) is greater than (0.05), and it is considered not statistically significant, and therefore, we conclude that there are no statistically significant differences between the mean of the sample responses on modern strategies for crisis management according to the respondent’s characteristic at the level of significance of 5%. The researcher explains this as the fact that most of the employees in the administrative units have the same job description.

Thus, "we accept the null hypothesis regarding the variable of the respondent’s quality", which says: There are no statistically significant differences between the averages of the respondents’ responses on modern strategies for crisis management according to the variable of the respondent's quality at the level of significance of 5%.

The following table also shows the results of the Levene test by age:

**Table (10) Levene test results according to the age variable**

<table>
<thead>
<tr>
<th>Levene value</th>
<th>degrees of freedom</th>
<th>Moral</th>
<th>Statistical significance</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.706</td>
<td>2</td>
<td>0.498</td>
<td>Statistically non-functional</td>
</tr>
</tbody>
</table>

Table (10) shows that the probability value is equal to (0.498) greater than (0.05), and it is considered not statistically significant, that is, the variance is homogeneous, so we do the parameter test (ANOVA).

The following table shows the results of the ANOVA test by age:

**Table (11): Anova test results by age**

<table>
<thead>
<tr>
<th>source of contrast</th>
<th>sum of squares</th>
<th>degrees of freedom</th>
<th>medium square</th>
<th>F value</th>
<th>Moral</th>
<th>Statistical significance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Between groups</td>
<td>0.001</td>
<td>2</td>
<td>0.001</td>
<td>0.498</td>
<td>0.990</td>
<td>Statistically non-functional</td>
</tr>
<tr>
<td>Within groups</td>
<td>8.276</td>
<td>57</td>
<td>0.145</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Total contrast</td>
<td>8.277</td>
<td>59</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Table (11): We conclude that there are no statistically significant differences between the average responses of the respondents about modern strategies for crisis management according to age at the level of significance of 5%, which is why the researcher indicates that the ages of the employees in the administrative units are close. The probability value (0.990) is greater than (0.05), which is considered not statistically significant. Therefore, "we accept the null hypothesis regarding the age variable," which states that: "At the 5% level of significance, there are no statistically significant differences between the averages of the respondents’ responses to modern strategies for crisis management".

We accept the second main hypothesis: There are no statistically significant differences in the perception of the research sample members of the modern crisis management strategies used in crisis management planning according to the variable (gender, educational qualification, respondent's character, age), at the level of significance of 5%.
XV. CONCLUSION
Information and communication technology plays many roles in the field of crisis management, whether by quickly reaching the crisis, by providing information and scenarios electronically, or by the availability of different information systems, or a specific crisis as determined by the specialist according to the criteria set by the decision-maker. As a result of this development in information systems, it has become the basis for advance planning to support decision-making in the stages of dealing with the crisis, by devising prediction and simulation models that help in making the appropriate decision at the right time, so information will remain the basic support for decision-makers and makers, while improving and stimulating The organization's communication movement, the formulation and implementation of the organization's strategies, and information and communication technologies allow quick access for all employees to all information useful for their tasks, and are associated with great opportunities for individual and group learning via the internet.

FINDINGS
1- The effect of modern crisis management strategies on crisis management planning is statistically significant.
2- The most modern strategies followed are the strategy of Crisis Fragmentation, followed by the strategy of Changing Path, then the strategy of containing the crisis, then the strategy of Crisis Exhausting, then the work teams, and finally the strategy of the tactical reserve.
3- There are no statistically significant differences between the mean responses of the respondents about the modern crisis management strategies used in planning crisis management according to the variable (gender, educational qualification, respondent's character, age), at the level of significance of 5%.

RECOMMENDATIONS AND SUGGESTIONS
1- Forming work teams for crisis management in colleges with expertise, and providing them with the necessary material and human support.
2- Diversifying the application of modern strategies for crisis management, in a manner appropriate to the type of crisis.
3- Spreading the culture of crisis management among employees, to encourage them to take the initiative in resolving them, or to suggest solutions.
4- The existence of a comprehensive database of the university about everything that happens, and updating this database continuously, to rely on it to predict the occurrence of crises, and plan for managing a such crises.
